# Afforestation and Climate Change: Government of Canada's Work Activities

---

Australia Bioenergy Association  
March 26, 2004

# Background

---

- As a result of the Kyoto Protocol, renewed interest in afforestation in Canada – now has a new economic and environmental dimension.
- Canada's afforestation activities focus on lands that were cleared for agriculture in the early 1900's.
- Lands tend to be unsuitable (i.e., unprofitable) for farming and have been abandoned.
- Small amount of afforestation occurring in Canada seems to be driven by a mix of objectives – watershed protection, fibre production and site rehabilitation.
- Policy Question - Will the potential market benefits of carbon be enough to encourage additional A/R in Canada?

# Background (cont.)

---

- The Government of Canada (GoC) is exploring the potential for afforestation to derive both environmental and economic benefits
- GoC interested in encouraging A/R through market mechanisms to help achieve its GHG emission reduction targets
- To help support this policy objective, two GoC A/R related initiatives are underway:
  - Feasibility Assessment of Afforestation for Carbon Sequestration (FAACS) initiative
  - Forest 2020 Plantation Demonstration and Assessment (PDA) initiative

# FAACS Initiative Overview

---

# FAACS Overview

---

- GoC's first steps to achieving Kyoto outlined in the *Government of Canada's Action Plan 2000 on Climate Change*.
- Included in Action Plan 2000 was the Feasibility Assessment of Afforestation for Carbon Sequestration (FAACS) initiative
- A three year initiative that focuses on exploring afforestation carbon sequestration opportunities.
- Main Objective:
  - Collect information to help assess the feasibility of afforestation as an effective measure in responding to Kyoto
- Expected Results:
  - Information and tools to inform policy decisions
  - Analysis on the use of large-scale afforestation as an effective climate change mitigation measure

# FAACS Work Plan

---

1. Land Assessment and Information Development
    - Evaluate existing information / Fill information gaps
    - Develop modeling tools to predict land availability and afforestation uptake
  2. Afforestation Pilot Projects
    - Test afforestation interest and participation rates
    - Obtain feedback from landowners and industry
  3. Other Linkages
    - Develop measurement and monitoring tools
    - Enhance public education and outreach
    - Conduct economic and social impact assessments
- Results will feed into the development of an Afforestation Feasibility Report

# Research Activities

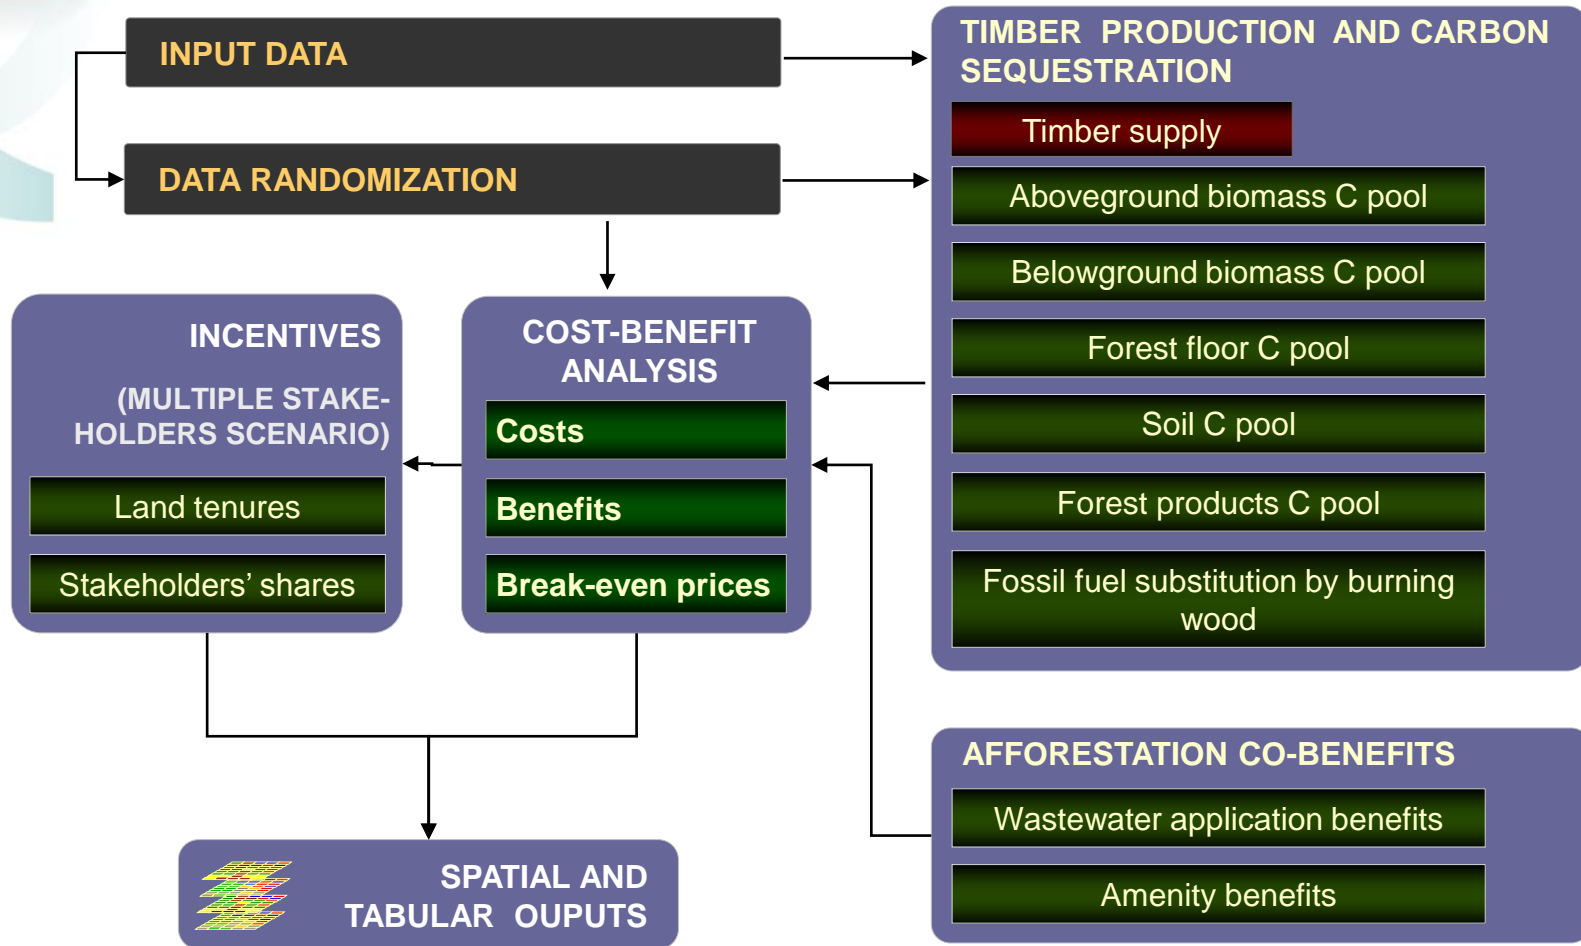

---

- Current information and model development projects:
  - Historical afforestation 1990 to 2002 in Canada
  - Responsiveness of landowners to various afforestation incentives
  - Economic benefits and costs information collection
  - Afforestation Land Suitability Model (G&Y predictions)
  - Carbon Budget Model work to track carbon stock change from afforestation activities
  - National guidelines (i.e., Protocols) to estimate project level carbon sequestration
  - Developing a National reporting system for A/R projects
  - Afforestation Economic Model and Information System

# A/R Economic Model

## Model Overview

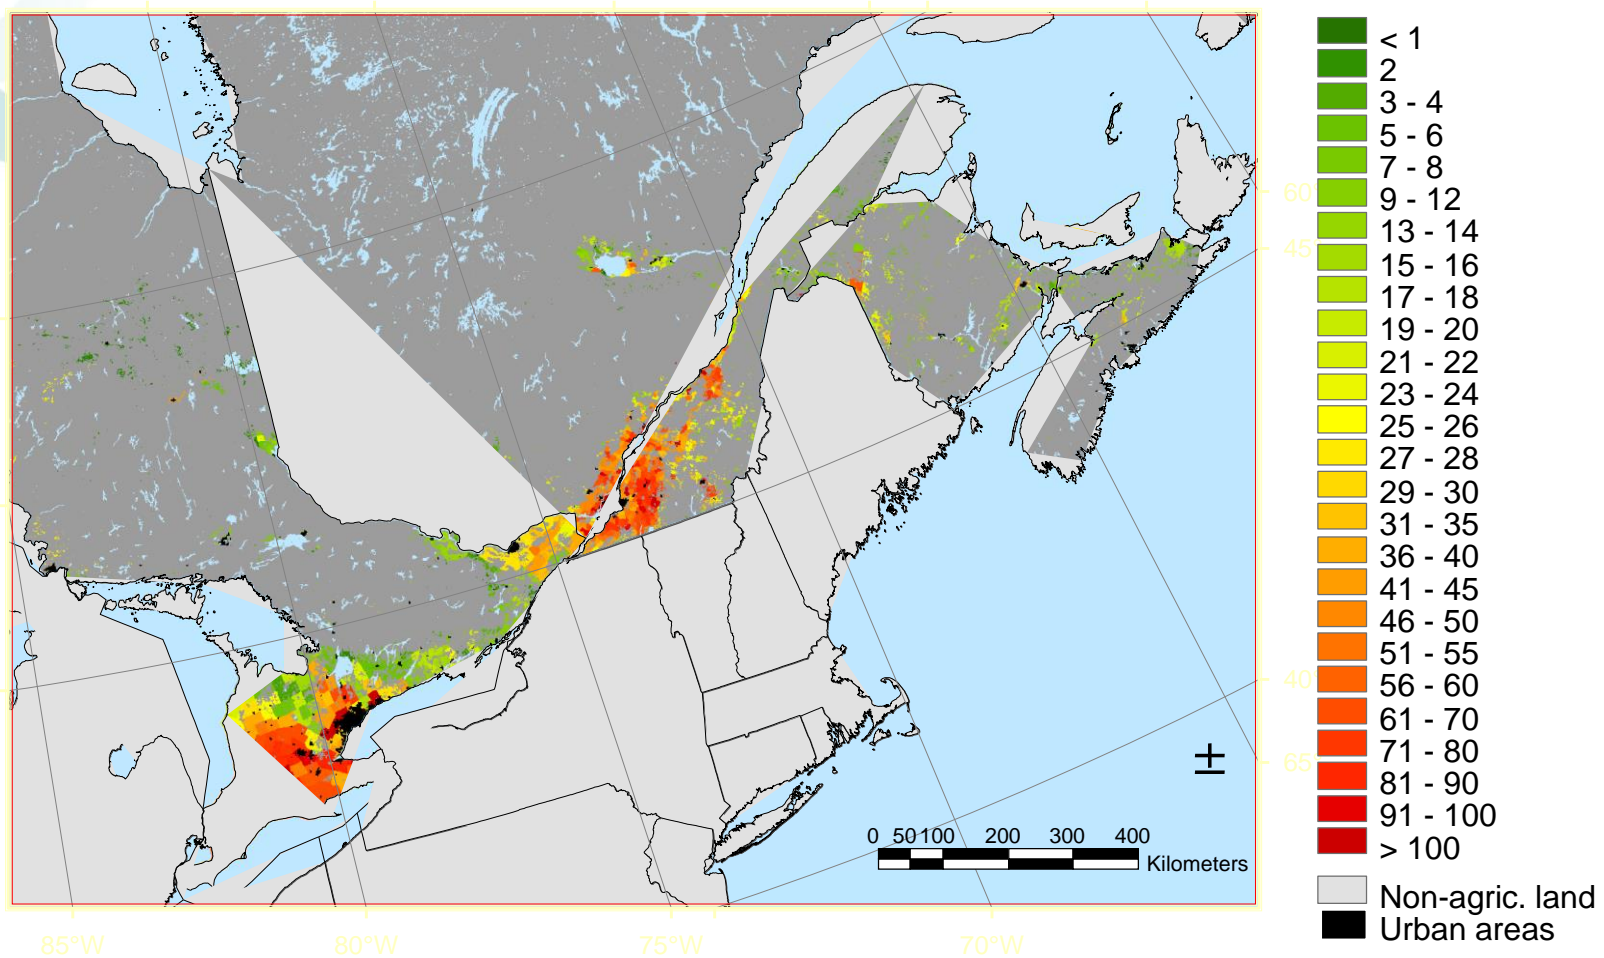

# Example of Model Results

## EXAMPLE FOR EASTERN CANADA

Mean values, \$ per tonne CO<sub>2</sub>

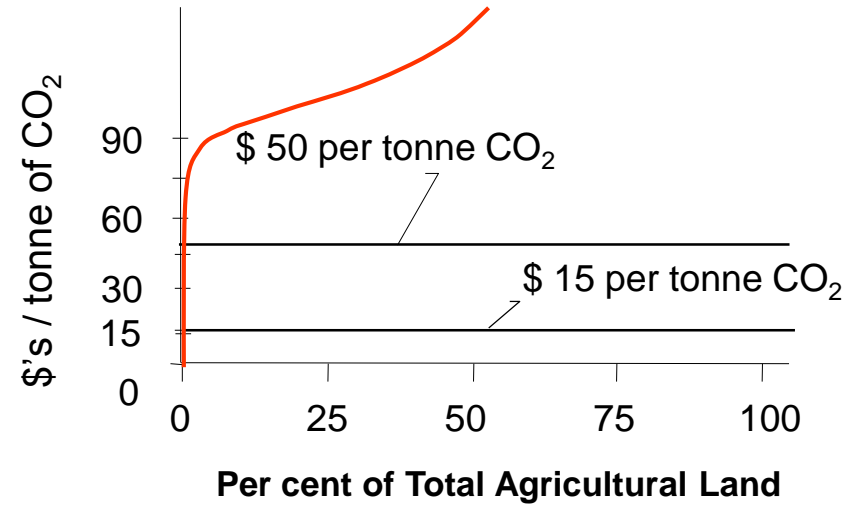

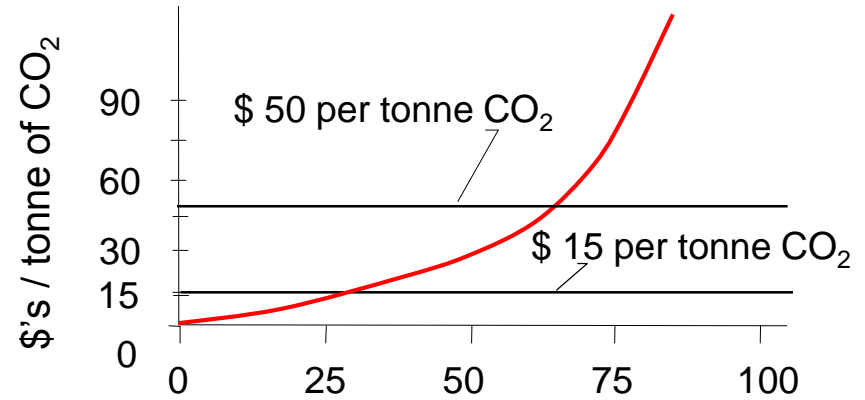

# Land vs CO<sub>2</sub> Values

## AREA OF LAND ECONOMICALLY ATTRACTIVE FOR AFFORESTATION

**EASTERN CANADA SCENARIO:  
20 m<sup>3</sup> / ha / yr**

**EASTERN CANADA SCENARIO:  
12 m<sup>3</sup> / ha / yr**

# Preliminary Observations

---

- From a biological perspective, significant amount of land available for afforestation in Canada
- Only a subset of this land is economically feasible (incorporating both carbon and fibre values)
- Broad scale afforestation in Canada seems to be profitable if:
  - focus on fast growing species  $> 12 \text{ m}^3 / \text{ha} / \text{yr}$  at 20 yr rotation (economics very sensitive to growth rates)
  - market exists for carbon and prices need to be moderate
  - long term credit (beyond 5 year commitment period) system exists
  - carbon market transactions costs can be minimized
- Need to explore how the values from other co-benefits influence the afforestation economics

# Forest 2020 PDA Initiative Overview

---

# F2020 PDA Overview

---

- *Climate Change Plan for Canada – August 2003*
  - Budget 2003: \$1 billion to support the federal investment in climate change mitigation actions
- Forest 2020 Plantation Demonstrations
  - Two-year, \$20 million, fast growing plantation investigation
- Objective
  - Demonstrate fast growing plantations across Canada and explore potential investment models to attract funds for future plantations
- Two Key Components
  - Investment Mechanism Options and Feasibility – policy, economics and science considerations
  - Fast Growing Plantation Demonstrations – regional partnerships with key players...e.g., governments, conservation groups, woodlot associations, etc.

# Investment Mechanisms

---

## ○ Goal:

- Assess economics of fast growing plantations and explore potential investment models and approaches to attract funds for future plantation

## ○ Planned Activities

- Economic assessment – are fast growing plantations a viable investment and what are the investment risks?
- Improve biophysical and economic information on fast growing plantations – limited information currently exists
- Investigate and develop options / approaches to attract private investment
  - Types of investment models?
  - Requirements for an efficient capital market environment?
  - What is the role for the Federal Government and Others?

# Demonstrations

---

- Goal
  - Establish fast growing plantation demonstration sites (6,000 ha)
- Planned Activities
  - Plantation demonstrations are being delivered at a regional level
  - Identify partners for delivery
  - Tree stock acquisition (fast growing species)
  - Identify suitable land for demonstrations (eligible under Kyoto)
  - Site preparation and plantation establishment (Spring / Fall)
  - Information collection and demonstration activities
- Current Status
  - Selecting partners for regional delivery
  - Some land has been identified and site preparation underway (very small amount)
  - Secure planting stock and prepare for Spring 2004

# Initiative Key Outcomes

---

- Showcase the use of fast growing plantations to help contribute to Canada's GHG emissions reduction commitments.
- Improve the knowledge and infrastructure to support the establishment of future plantations in Canada
- Test how afforestation projects would work in a domestic offset trading system
- Identification of realistic set of investment mechanisms and approaches to encourage private investment in Canadian plantations

# Concluding Comments

---

- Significant amount of work in Canada examining opportunities to encourage afforestation to address climate change and fibre supply needs
- Interest in pursuing market-based approaches to encourage action – helps ensure long term solution
- Developing information and tools to help policy makers, industry, landowners understand potential afforestation returns – address market information needs
- Working in partnership with other levels of government, industry and associations to evaluate the merits of pursuing afforestation as an effective climate change mitigation activity

# ANNEX

# Afforestation Research Project Descriptions

---

# Historical Afforestation

---

## ○ **Description**

- Quantify past afforestation in Canada (1990 to 2002)
- CFS Forestry Centres working in partnership with jurisdictions, private sector, and conservation organizations to document historical afforestation
- Data is stored in a national database and will be used to derive carbon sequestration impacts

## ○ **Expected Outputs**

- Data on afforestation from 1990 to 2002 (location, annual planting estimates, species, etc.)
- Carbon sequestration impacts over 2008 to 20012

# Incentives Review

---

## ○ **Description**

- Determine the practical set of economic incentives that make sense for Canada
- Study incentive successful and unsuccessful mechanisms from Canadian and foreign experiences
- Explore the barriers facing Canadian afforestation

## ○ **Expected Outputs**

- Phase 1 - Report of potential afforestation incentives mechanisms
- Phase 2 - Report on favourable Canadian incentive options

# Rural Landowners Survey

---

## ○ **Description**

– Environics Research Group completed National Survey of Rural Landowners – Spring 2003

- [http://www.stewardshipcanada.ca/documents/national\\_rurallandownersurvey2003.pdf](http://www.stewardshipcanada.ca/documents/national_rurallandownersurvey2003.pdf)

– Focus on land stewardship including question on afforestation activities and incentives

– Supplementary analysis to drill down on the results

## ○ **Expected Outputs**

– Series of reports - effects of different economic incentives and land availability

# Economic Modeling

---

## ○ Description

- Development of a spatially explicit cost-benefit afforestation information system
- The system examines the link between the biology and economics of afforestation on agricultural lands inclusive of uncertainty in biology and economics
- Identify land and conditions / assumptions for economically attractive afforestation investments

## ○ Expected Outputs

- Spatially explicit economic model of afforestation potential
- Economic tool for research, industry and governments
- Tabular output and colour coded maps are both produced
- Scenario analysis – “What if?” tool

# Land Suitability Modeling

---

## ○ **Description**

- Development of an evaluation system that matches tree species with site characteristics
- Prairie-wide pilot system based on GIS and spatial biogeoclimatic input to analyze various tree species on different sites
- The model will produce land suitability classifications and yield potential estimates – linkages with economic model

## ○ **Expected Outputs**

- Land suitability and classification model
- Coarse scale growth and yield predictions
- Project report and manual

# Risk Assessments

---

## ○ **Description**

- Conduct a science risk assessment workshop on fast growing plantations
- Assess and quantify plantation specific risks
  - Insects, disease, fire, drought, etc

## ○ **Expected Outputs**

- Fast Growing Plantation Risk Assessment Report
- Results will feed into the Carbon Budget Model afforestation module and economic model parameters

# Incentives Pilots

---

## ○ **Description**

- Establish information collection partnerships with provinces, industry and landowner associations
- Obtain feedback from landowners on a range of incentives to expand forest cover
- Feedback collected from surveys and workshops

## ○ **Expected Outputs**

- Test responsiveness of landowners to various incentives
- Quantitative data and documentation of attitudes
- Report on pilot findings

# Carbon Accounting Tools

---

## ○ **Description**

- Develop tools to track carbon stock change from afforestation activities
  - Afforestation module for the Carbon Budget Model (CBM-CFS) to estimate carbon impacts
- Develop a national database to store afforestation events

## ○ **Expected Outputs**

- Information tools to estimate afforestation carbon stock changes
- National database to store afforestation activities - linked into CBM-CFS

# A/R Project Reporting System

---

- **Description**

- Development of a national reporting system for A/R projects
- An internet based reporting tool to facilitate national reporting and carbon modeling

- **Expected Outputs**

- Internet based afforestation/reforestation project reporting tool

# Afforestation M&M Protocols

---

## ○ **Description**

- Development of a set of national guidelines to assist land managers in estimating carbon sequestration from A/R projects – Afforestation protocol example
- Protocol will include guidelines for: site assessment, measurement and monitoring of growth and yield, and site parameters for carbon accounting

## ○ **Expected Outputs**

- Example of a carbon measurement, monitoring and verification protocol for A/R projects
